

THE HEPA-AIRE PORTABLE POWER VAC AND COMPRESSOR ON A-TYPICAL DUCT SYSTEM.

The HEPA-AIRE Portable Power Vacuum is attached to the ductwork so that when it is in operation the dirt and debris dislodged by the Aire-Sweep is pulled into the HEPA-AIRE. The multi-stage filtration system uses HEPA filters as the final stage to assure that the Exhausted Air is "Operating Room" Clean.

The Aire-Sweep™ Portable air compressor is used to power the Aire-Sweep nozzle through the entire duct system. As it is pulled back, compressed air is shot through the nozzle loosening the debris and "sweeping" it back toward the HEPA-AIRE Portable Power Vac.
